IronWrap internal OS — final spec pack

The final implementation specification for IronWrap's internal operating system: the system to set up, configure, build, test, and ship. This is not the external metal-layout SaaS idea.

IRONWRAP EXTERIORS • 16-PART PACK • REV. JUNE 2026

Final direction

Implement the existing-stack operating spine first:

- **GHL** — lead intake, booking, SMS, nurture, reviews, and the first Phone AI rollout.
- **JobNimbus** — customer, property, job, stage, task, owner, and the canonical job number.
- **Make** — existing automation glue, with cleanup, ownership, logs, and failure handling.
- **NaturalForms** — mobile / offline field forms, signatures, photos, sketches, and form output, because IronWrap already has it.
- **Google Drive** — the first storage authority; OneDrive only if the owner overrides.
- **QuickBooks** — accounting truth only.
- A simple proposal / PDF flow before any heavy proposal suite.
- Deterministic document extraction first, free OCR second, paid OCR only when needed.
- Security / access hardening last — after build, config, and test — with basic access containment from day one.

The first deliverable targets **CAD $0 new-vendor setup**, because IronWrap already has Make, NaturalForms, Google, RoofRuler, QuickBooks, JobNimbus, and GHL access. The first move on lead growth is to fix routing, attribution, and follow-up on the website forms and GHL that already exist — not to rebuild the site or buy ads. Renoworks, Paradigm, alternate voice platforms, paid OCR, custom dashboards, paid local ads, CallRail, and a website rebuild stay gated until a tested workflow proves the need.

Pack index

NO.	DOCUMENT
00	Final decisions

NO.	DOCUMENT
01	System architecture
02	Build & configuration plan
03	Data model & source of truth
04	Core workflows & SOPs
05	Phone AI automation layer
06	Integrations & automations
07	Documents, measurements & proposals
08	Costs, vendors & buy gates
09	Security, privacy & Canadian compliance
10	QA, launch & acceptance
11	Owner signoff checklist
12	Implementation backlog
13	Source verification notes
14	Task 1 coverage audit
15	First deliverable — existing-stack plan

What counts as shipped

Task 1 is shipped only when:

- Leads from website pages, service-page forms, Google Business Profile, phone, SMS, ads, referrals, and manual entry land in one queue.
- Website and service-page leads keep their source page, page type, service intent, location, attachment, and next step on the way into GHL.
- Qualified leads create / update JobNimbus without duplicates.
- JobNimbus owns the canonical job number and job stage.
- Job folders are created once and linked back to GHL and JobNimbus.
- Appointment, proposal, deposit, material request, completion, invoice, and review paths work end to end.

- NaturalForms forms can be dispatched, completed, archived, and reflected back into JobNimbus / Google without retyping.
- Phone AI can qualify, book, update CRM records, summarize, trigger follow-up, and escalate in the approved pilot scope.
- Staff can run test jobs without developer support.
- Every critical automation has an owner, test record, kill switch, and failure alert.
- Final security / access hardening is complete.
- Canadian privacy, CASL, call-recording, DNCL, retention, and vendor-processing gates are approved.

Build governance

Each implementation slice ends with:

- Configuration or code changed.
- A test record created.
- The result checked in GHL / JobNimbus / storage / QuickBooks as applicable.
- The failure path tested.
- The SOP updated if staff behavior changes.
- Owner signoff captured for production-sensitive changes.
