Build & configuration plan

The order of operations — preflight containment through production launch — and the gate each phase has to clear before the next one begins.

IRONWRAP EXTERIORS • REV. JUNE 2026

Build order

Security and access hardening lands last — after build, config, and test — which is the call from the decision record. Basic containment still applies the whole way through: don't stand up new production dependencies on shared, pasted credentials.

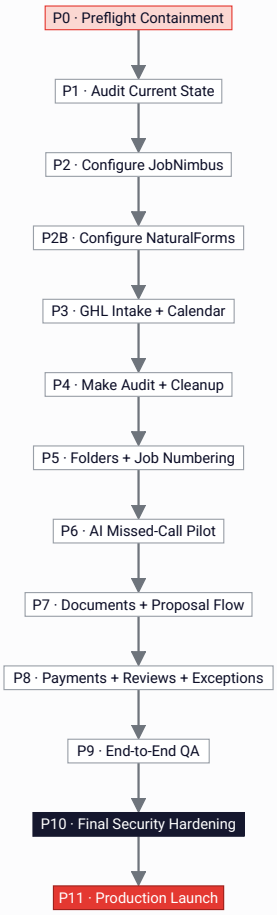

FIGURE 1 — PHASE SEQUENCE, P0 PREFLIGHT TO P11 LAUNCH

Phase 0 — Preflight containment

GOAL

Avoid making the current access situation any worse before the final hardening phase.

ACTIONS

- Inventory current GHL, Make, JobNimbus, QuickBooks, storage, website, and phone access.
- Identify live Make connections, API keys, webhooks, phone numbers, and folder automations.
- Use test contacts and jobs wherever possible.
- Pause or duplicate dangerous scenarios before editing them.
- Don't create new broad admin or API keys unless testing genuinely requires it.
- Keep an access inventory ready for the final rotation.

DONE WHEN

- We know which connections are live.
- We know which test records are safe to use.
- No new production workflow depends on a shared personal login.

Phase 1 — Current-state audit

AUDIT

- GHL — locations, calendars, forms, funnels, workflows, pipelines, AI settings, phone/SMS setup.
- Make — scenarios, schedules, webhooks, error handlers, connections, data stores, folder mutations.
- JobNimbus — boards, statuses, custom fields, automations, templates, users, roles, integrations.
- NaturalForms — plan level, users, templates, JobNimbus integration, webhook/output settings, API access, eSignature, offline/photo/sketch behavior.
- QuickBooks — connection state, product/service setup, invoice and deposit behavior.
- Website form destinations — where home, quote, contact, and service-page forms actually deliver, and whether they reach GHL.
- Website attribution fields — source URL, landing page, page type, and hidden service fields per form.
- UTM handling — whether utm_source / medium / campaign / content / term are captured and stored.
- Landing-page and traffic-source capture.
- Call source capture — whether inbound calls map to a page or campaign.
- Google Business Profile — categories, service areas, hours, phone, website URL, photos, services, review link, and optional booking link.
- Google Drive naming and folder structure.

- RoofRuler — email source, sender pattern, mailbox rules, attachment naming, and current proposal-packet examples.

OUTPUT

- Keep / fix / pause / delete list for automations.
- Field-gap list for JobNimbus.
- Integration dependency map.
- Duplicate-risk list.

Phase 2 — JobNimbus configuration

Configure JobNimbus as the job truth.

BOARDS

- Start with one Residential board unless Commercial or Shop/Supply workflows genuinely differ.
- Add Commercial and Shop/Supply boards only if their stages, owners, or forms are actually different.

STAGES

1. Lead
2. Appointment
3. Estimating
4. Proposal Sent
5. Pending Signature
6. Signed
7. Deposit
8. Materials
9. Scheduled
10. In Progress
11. Completion
12. Invoice
13. Closed Won
14. Closed Lost

REQUIRED SETUP

- Job number format.
- Lead source list.
- Service interest fields.
- Task types.
- Note types.
- Attachment categories.

- Property fields.
- Division fields — Residential, Commercial, Shop/Supply, Steel.
- Owner / assignee roles.
- Required fields per stage.

DONE WHEN

- A test job can move from lead to closed without unstructured workarounds.
- Every stage has an owner and a next action.

Phase 2B — NaturalForms setup

Configure NaturalForms — IronWrap already owns it, so it carries the first-deliverable field layer.

USE NATURALFORMS FOR

- Work orders.
- Additional work orders / change orders.
- Equipment and machinery requests.
- Completion forms.
- Inspection forms.
- Material requests.
- Safety forms.
- Contract / signature documents, if the terms are approved.
- Material lists, if the layout works for office and shop.
- Photos, sketches, signatures, and offline field capture.

INTEGRATION ORDER

1. Native JobNimbus integration if the account supports it and the mapping is reliable.
2. NaturalForms Web Apps / generic webhook output into Make.
3. NaturalForms output files or structured exports into Google storage and JobNimbus attachments/notes.
4. REST API only if the current plan already includes it, or the webhook route can't support delivery.

DONE WHEN

- One test form can be completed from a phone or tablet.
- The PDF/output is archived to the job folder.
- JobNimbus receives the right note / task / status without spawning a duplicate job.
- Make logs the event and its failure path.

Phase 3 — GHL intake & calendar

Configure GHL as the front door.

INTAKE SOURCES

- Website form.
- Quote page.
- Contact page.
- Service-page forms with hidden service fields.
- Google Business Profile.
- Phone call.
- SMS.
- Referral.
- Manual entry.
- Paid Google / LSA — only after the readiness gate passes.
- Optional Renoworks.

PIPELINE

- New Lead.
- Contacted.
- Appointment Booked.
- Estimate Needed.
- Proposal Sent.
- Won.
- Lost.

CALENDAR

- Appointment types by service.
- Working hours.
- Buffers.
- Territory / service-area rules.
- Confirmation SMS / email.
- Reschedule / cancel path.
- No-show follow-up.

DONE WHEN

- Every new lead lands in GHL.
- Website leads preserve source URL, landing page, page type, service, city, UTM / source data, attachment, and message.
- Google Business Profile has an approved review link and a source label.
- Qualified-lead handoff to JobNimbus is deterministic.
- Appointment confirmation works.

Phase 4 — Make audit & cleanup

> **OPERATING RULES**
>
> - One automation owns one action.
> - No two scenarios create or rename the same folder.
> - No hidden logic buried in scenario names.
> - Every scenario has error handling.
> - Every scenario has a test record.
> - Every production scenario has a kill switch.

CLEANUP STEPS

1. Export or document current scenario settings.
2. Label each scenario keep / fix / pause / delete.
3. Disable duplicates and dangerous competing folder automations.
4. Add dedupe before creating JobNimbus jobs.
5. Add idempotency keys before folder creation.
6. Add failure notifications.

DONE WHEN

- A duplicate GHL lead does not create a duplicate JobNimbus job.
- A job-number update does not create a duplicate folder.
- A failed automation creates a visible admin task or alert.

Phase 5 — Job numbering & folders

FINAL DECISION

- JobNimbus owns the canonical job number.
- A GHL lead ID can exist, but it is not the job number.
- The folder name is derived from the JobNimbus job number plus a customer/property label.

FOLDER PATTERN

```
{job_number} – {customer_last_or_company} – {property_short_address}
```

FOLDER SUBSTRUCTURE

```
01 Intake
02 Measurements
03 Photos
04 Proposal
05 Contract
06 Materials
07 Field
08 Invoice
09 Warranty
```

DONE WHEN

- One qualified job creates exactly one folder.
- The folder link appears in JobNimbus and GHL.
- The folder archive does not decide job status.

Phase 6 — AI missed-call / after-hours pilot

START SMALL

- Missed-call recovery.
- After-hours inbound calls.
- Human transfer.
- Call summary.
- Booking into the GHL calendar.

Don't replace human live-answer during business hours until the pilot recordings pass.

DONE WHEN

- Test calls qualify, book, summarize, and escalate.
- Failed calls create human tasks.
- Ilya approves the pilot recordings and summaries.

Phase 7 — Documents & proposal flow

BUILD

- RoofRuler email intake for auto-delivered report PDFs.
- An upload convention for manual reports and photos.
- A simple HTML / PDF proposal.
- NaturalForms signature/contract path if it meets the requirement.
- PDF archive to the job folder.

- AppliCad XML parser.
- PDF text extraction.
- Free OCR fallback.
- Mistral OCR for hard cases only.
- Human review before price or material truth.

- Contract decision — JobNimbus native signing vs NaturalForms Form #8.
- Material-list decision — one multi-scope list vs per-scope forms.

DONE WHEN

- Measurement docs are attached and either extracted or flagged.
- RoofRuler email attachments archive to the correct job folder.
- A proposal can be sent from a job record.
- The customer can view it on mobile.
- Signed / accepted / deposit state returns to JobNimbus.

Phase 8 — Payments, reviews, exceptions

PAYMENTS

- QuickBooks owns invoices and payment records.
- JobNimbus shows deposit status, invoice status, and a paid/overdue flag.
- No automatic invoice creation from unreviewed pipeline state.
- Validate accepted payment methods before any customer-facing proposal launch — cash/cheque/draft/direct deposit, Interac e-Transfer, Interac debit, credit card, and FinanceIT.
- Keep Moneris / FinanceIT details out of AI logs and broad CRM notes.

REVIEWS

- Request a review after completion and an eligible-customer signal.
- Stop on any issue, complaint, dispute, or incomplete job.

EXCEPTIONS

- New unassigned leads.
- Missed calls.
- Leads not contacted.
- Appointment no-shows.
- Stale jobs by stage.
- Pending proposals.
- Deposit missing.
- Materials not ready.
- Completed not invoiced.
- Overdue invoices.
- Failed automations.

DONE WHEN

The owner can see the day's blockers without manually reconciling across systems.

Phase 9 — End-to-end QA

Run test jobs across every path before launch.

REQUIRED TEST RECORDS

- Website lead.
- Phone lead.
- Missed-call AI lead.
- Duplicate lead.
- Appointment booked.
- Proposal sent.
- Proposal accepted.
- Deposit requested.
- RoofRuler report email received.
- Manual measurement uploaded.
- Material request submitted.
- Completion form submitted.
- Invoice requested.
- Review request sent.
- Automation failure.
- API key revoked.

Phase 10 — Final security & access hardening

This happens after build, config, and test — before full production launch.

ACTIONS

- Rotate pasted / shared credentials.
- Revoke stale API keys and sessions.
- Replace shared logins with named users.
- Enable MFA where possible.
- Create service accounts where supported.
- Store secrets in a password manager.
- Lock down integration scopes.
- Approve the vendor register.
- Approve retention and call-recording rules.
- Approve CASL / DNCL handling.

Phase 11 — Production launch

LAUNCH ONLY WHEN

- Test records pass.
- Staff SOPs are reviewed.
- Failure alerts work.
- Kill switches are documented.
- Compliance gates are approved.
- The owner signs off.
