First deliverable — existing-stack plan

The maximum useful IronWrap internal OS for minimum new spend — built entirely on tools IronWrap already pays for, with a target of CAD $0 in new vendor setup.

IRONWRAP EXTERIORS • REV. JUNE 2026

The assumption from discovery: IronWrap already has subscriptions or active access for Make, NaturalForms, Google, RoofRuler, QuickBooks, JobNimbus, and GHL. Target new-vendor spend for this first deliverable is **CAD $0** — incremental cost should be limited to usage already approved, such as SMS / phone, storage overage, or per-report measurement costs.

First-deliverable boundary

BUILD NOW

- JobNimbus operating core.
- NaturalForms field / document layer.
- Make automation cleanup and routing.
- Google job folders / archive.
- RoofRuler email-report and AppliCad measurement intake.
- QuickBooks status visibility and reviewed payment workflow.
- GHL lead / booking / review workflows, if the subscription stays active.
- Existing website / quote / contact / service-page forms routed into GHL.
- Website and GBP leads preserving source, service intent, location, attachment, and next step.
- Google Business Profile audit — categories, service areas, hours, photos, review link.
- Owner exception dashboard from existing reports or Google Sheets.

HOLD FROM TASK 1

- Renoworks.
- Paradigm.
- PandaDoc / DocuSign.
- Custom dashboard product.
- Alternate phone AI infrastructure.
- Paid OCR by default.
- NaturalForms REST API upgrade, unless required after testing.
- Moneris / FinanceIT customer-facing rollout, unless already approved.
- CallRail — unless GHL attribution fails real tests.
- Paid local ads / Local Services Ads — until the readiness gate passes.
- Website rebuild or new landing-page platform.

Build sequence

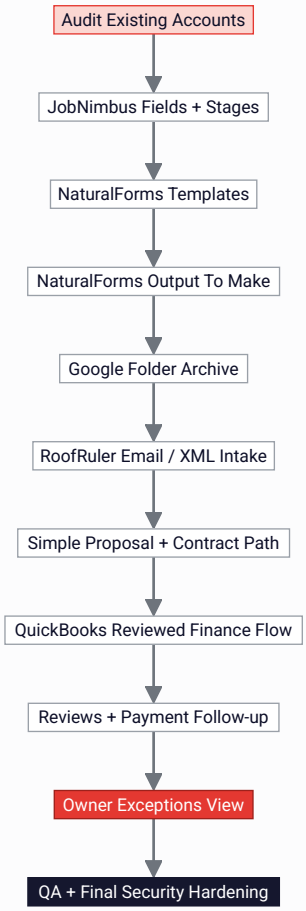

FIGURE 1 — EXISTING-STACK BUILD ORDER, AUDIT TO LAUNCH

NaturalForms first

Use NaturalForms immediately wherever mobile / offline capture, photos, sketches, signatures, and repeatable output matter.

TEMPLATE	PURPOSE	SYSTEM EFFECT
Work order	Give crew / shop clear work instructions	PDF archived; JobNimbus task / status updated
Additional work order / change order	Capture extra work or scope changes	PDF archived; sales / office review task

TEMPLATE	PURPOSE	SYSTEM EFFECT
Equipment & machinery request	Request lifts, machines, or special equipment	Production task and blocker visibility
Completion form	Close field work with photos / signature	Completion status and invoice / review path
Inspection form	Capture pre / post inspection evidence	Review task if failed / blocked
Materials request	Convert an approved job into material action	Materials status and shop / office review
Safety form	Capture field safety evidence	Archived compliance record
Contract / customer acceptance	Capture approved terms / signature	Signed / accepted status after office review
Material list	Make material data usable by office / shop	Attached material record; Paradigm after approval

INTEGRATION PRIORITY

1. Native NaturalForms → JobNimbus mapping.
2. NaturalForms Web Apps or generic webhook output to Make.
3. Make stores the PDF / output in the right Google job folder.
4. Make updates the JobNimbus note / task / status using the canonical job number.
5. REST API only if this can't be done through existing integration / webhook paths.

Minimum-cost automation rules

- Use Make webhooks and current app connections.
- Use Google Sheets only for exception dashboards and logs — not as a second CRM.
- Use the JobNimbus job number as the folder and form matching key.
- Use the NaturalForms completed-document ID as the form idempotency key.
- Don't create QuickBooks invoices from form submissions without office review.
- Don't send customer documents / photos to cheap or free AI providers.
- Don't build a relay unless Make can't provide idempotency or failure alerts.

First working demo

The first demo should prove one full loop:

1. Create or choose a test JobNimbus job.
2. Generate or attach the Google job folder.
3. Process a sample RoofRuler report email and archive the PDF to the folder.
4. Dispatch a NaturalForms work order or material request.
5. Complete it on mobile / tablet with photo / sketch / signature if relevant.
6. NaturalForms sends output to Make or JobNimbus.
7. Make archives the output in the job folder.
8. JobNimbus shows the form note / task / status.
9. The owner exception view shows no blocker.
10. A failure test proves staff sees a recovery task.

First-deliverable acceptance

ACCEPTED WHEN

- No new paid vendor is required.
- JobNimbus remains job truth.
- NaturalForms forms are usable in the field.
- Completed forms archive to the correct Google folder.
- Completed forms update the correct JobNimbus record.
- RoofRuler email reports and AppliCad files are attached and extracted or flagged.
- QuickBooks remains the accounting truth.
- Reviews / payment follow-up run through existing tooling.
- Staff can run a test job without developer help.
- GHL call tracking / number pools are tested before any paid call-attribution tool is purchased.
- Paid local lead channels stay off until response-time, dedupe, attribution, and owner exceptions pass.
- Credential rotation, MFA, roles, vendor register, and privacy / consent / call / SMS gates are complete.

Upgrade triggers

Only spend more when a test proves a real blocker:

UPGRADE	TRIGGER
NaturalForms REST API / Grow	Native JobNimbus integration and webhook output can't route completed forms reliably
Paid OCR / Mistral OCR 4	Real reports can't be extracted with XML / PDF / free OCR and manual-review cost is too high
Expanded Phone AI	Missed, after-hours, or selected inbound calls are still being lost after the controlled pilot
Renoworks	Visualizer demos are part of a deliberate sales process and likely to improve close rate
Paradigm	The manual material-request flow is stable and shop volume justifies ERP setup
Custom dashboard / relay	Make + Google Sheets + native reports can't show owner blockers or failure recovery
